The invention relates to a composition comprising at least one peptide having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducting a cytotoxic T cell response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic CT cells from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is composition on the antigen-presenting cell, where when an A2 restricted cytotoxic lymphocyte (CTL) is present, a receptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADW29251.

ADW37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a composition comprising at least one peptide having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic reall response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic reals from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is composition composition on the antigen-presenting cell, where when an AZ restricted cytotoxic lymphocyte (CTL) is presenting cell, where when an AZ restricted cytotoxic lymphocyte (CTL) is present, a receptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-pepcific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADM29251.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Virucide; cytostatic; gene therapy; vaccine; epitope; cytotoxic T cell; MHC class I; CTL; HTL; A2-restricted cytotoxic lymphocyte; HLA; viral disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                             New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a composition comprising at least one peptide chaving an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic real response against a pre-selected antigen in a cc material a specific MFC class I allele by contacting cytotoxic relistrom the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is composition composition composition complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or capangosing viral diseases and cancer. The peptide epitopes are useful as diagnostic agents for evaluating immune responses, for making antibodies and for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADW29251-
                                                                                                                                                                                                                                                              New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                    ö
                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABR30021). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of

assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB7577-ADB75631 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparastic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection; neoplastic disease; autoimmunity; toxicity; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an WHC class II beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, where the effector component is linked to the MHC class II component. Also described: (1) a pharmaceutical composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New MHC class II compound, useful for preparing a composition for treating immune disorders e.g. viral infections, bacterial infections, parasitic infections, neoplastic disease, autoimmunity or toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a new isolated lung specific nucleic acid molecule (I) comprising any of 113 fully defined nucleotide sequences given in the specification, their encoded protein sequences, sequences selectively hybridizing to the nucleotide sequences or a sequence having at least 60% identity to the nucleotide sequences. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the
comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of regulating an immune response in a subject; (5) a method of treating an immune disorder in a subject; (6) a method of treating an immune disorder ex vivo in a subject; and (7) a method of treating an immune disorder ex vivo in a subject; and extracting, antiparasitic, cytostatic and immunesuppressive activities, and can be used in gene therapy. The MHC class II compound (1) can be used for preparing a composition for treating immune disorders, e.g., viral infections, bacterial infections, parssitic infections, neoplastic disease, autoimmunity or toxicity. The present sequence represents a spaceholder molecule peptide, which can be used in an MHC class II compound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated human lung specific nucleic acid molecule, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; gene therapy; vaccine; lung; diagnosis; cancer; non-cancerous lung disease; lung tissue; antagonist; gene therapy; transgenic animal; splice variant.

ö
polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. Lung specific genes (LSGs) were identified by a systematic analysis of gene expression data in the LIFESEO Gold database using the data mining software package candidate lead automatic search program (CLASP). Genes were grouped into gene bins where each bin is a cluster of sequences grouped together where they share a common contig. Differentially expressed tissue-specific genes were selected based on the percentage level in the targeted tissue versus all the other tissues. The expression levels for each gene in libraries of normal tissues or non-tumour tissues from cancer patients were compared with the expression levels in tissue libraries associated with tumour or disease. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                             Gaps

The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme improving plant tolerance to cold, heat, drought, herbicides, extreme commotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosyntheeis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one

The invention relates to isolated polymucleotide (I) and polypeptide (II)

sequences. (I) is useful as hybridisation probes, polymerase chain

caction (PCR) primers, aligomers, and for chromosome and gene mapping,

and in recombinant production of (II). The polymucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

cartivity of (II) or to treat disease states involving (II). (II) is

cusful for generating antibodies against it, detecting or quantitating a

cutivity of (II) and its binding partners are useful in medical imaging

co sites expressing (II). (I) and its binding partners are useful for treating disorders

co polypeptide and polymucleotide sequences have applications in

co sites expressing (II). (I) and (II) are useful in medical imaging

cof sites expressing (II). (I) and its binding partners are useful for treating disorders

convolving aberrant protein expression or biological activity. The

convolving aberrant protein expression or biological activity. The

convolving aberrant protein expression or biological activity. The

convolving aberrant protein expression or biological activity.

convolving aberrant protein expression or biological activity or and activity activity.

It is an example of copeptides of the invention that were designed to bind to the groove of human leukocyte antigen HLA-DR1 and HLA-DR4 molecules. The copeptides show a high affinity for major
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New terpolymers, copeptides and copolymer 1 which contain three amino acids randomly joined in a linear array where one is aromatic, one is aliphatic and the other is charged, used to treat autoimmune diseases.

histocompatability complex (MHC) class II proteins associated with an autoimmune disease, especially HLA-DR1, HLA-DR2 or HLA-DR4, bind to antigen presenting cells, and inhibit T cell responses. They are especially used to treat multiple sclerosis, autoimmune haemolytic anaemia, autoimmune coophoritis, autoimmune thyroiditis, autoimmune thyroiditis, autoimmune sensitivity disease, diabetes mellitus, Graves disease, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, dilliain-Barre's syndrome, Hashimoto's disease, idiopathic myxedema, myasthenia gravis, psoriasis, pemphigus vulgaris, rheumatoid arthritis and systemic lupus erythematosus (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New terpolymers, copeptides and copolymer 1 which contain three amino acids randomly joined in a linear array where one is aromatic, one is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                          uveoretinitis, chronic immune thrombocytopenic purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxedema, myasthenia gravis, psoriasis, pemphigus vulgaris, rheumatoid arthritis and systemic lupus erythematosus (all claimed). The present peptide is a high level inhibitor of both HLA-DR-1 and -DR-4-restricted type II collagen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chronic immune thrombocytopenic purpura; collitis; contact sensitivity disease; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; Hashimoto's disease; idiopathic myxedema; Guillain-Barre's syndrome; Hashimoto's disease; idiopathic myxedema; myasthenia gravis; psoriasis; pemphigus vulgaris; rheumatoid arthritis; systemic lupus erythematosus; imunosuppressant; neuroprotective; systemic lupus erythematosus; imunosuppressant; neuroprotective; antianthyroid, antidiabetic; thyromimetic, antipsoriatic; antiarthritic; dermatological; antiinflammatory; therapy; major histocompatibility complex; MHC class II; human lymphocyte antigen;
                                                                                    The present sequence represents a copeptide that can be used to treat autoimmune conditions. It is an example of copeptides of the invention that were designed to bind to the groove of human leukcoyte antigen HiA-DR1 and HIA-DR4 molecules. The copeptides show a high affinity for major histocompatability complex (MHC) class II proteins associated with an autoimmune disease, especially HIA-DR1, HIA-DR2 or HIA-DR4, bind to antigen presenting cells, and inhibit T cell responses. They are especially used to treat multiple sclerosis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune
aliphatic and the other is charged, used to treat autoimmune diseases.

The present sequence represents a copeptide that can be used to treat autoimmune conditions. It is an example of copeptides of the invention that were designed to bind to the groove of human leukocyte antigen HLA-DR1 and HLA-DR4 molecules. The copeptides show a high affinity for major histocompatability complex (MHC) class II proteins associated with an autoimmune disease, especially HLA-DR2 or HLA-DR2 or HLA-DR2. They are especially used to treat multiple sclerosis, autoimmune obportits, and inhibit T cell responses. They are especially used to treat multiple sclerosis, autoimmune had autoimmune ophoritis, autoimmune thyroidatis, autoimmune employeritis, autoimmune thyroidatis, autoimmune employeritis, autoimmune weoretinitis, chronic immune thrombocytopenic purpura, colitis, contect sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxedema, myasthenia gravis, psomphigus vulgaris, rheumatosid arthritis and systemic lupus erythematosus (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MHC class II; major histocompatibility complex; autoimmune disease; inflammatory disease; binding; rheumatoid arthritis; antiinflammatory; antiarthritic; multiple sclerosis.
                                                                                                                                                                       New terpolymers, copeptides and copolymer 1 which contain three amino acids randomly joined in a linear array where one is aromatic, one is aliphatic and the other is charged, used to treat autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New synthetic peptide, useful for treating autoimmune disease, e.g. rheumatoid arthritis.

The present invention describes synthetic peptides having an amino acid sequence comprising at least 3 residues selected from the group of amino acids consisting of aromatic acids, negatively charged amino acids, positively charged amino acids, and aliphatic amino acids, the synthetic peptides being at least 7 amino acid residues in length and capable of binding to a major histocompatibility complex (MHC) class II protein associated with an autoimmune disease. The synthetic peptides have anticinflammatory and anti-arthritic activities. They are used to treat inflammatory and demyelinating autoimmune diseases, especially rheumatoid arthritis and multiple sclerosis. The peptides are specific for particular MHC class II alleles. Purified, short and synthetic peptides should have fewer side effects than mixtures of random peptides; may include many repeats of the active sequence and/or contain amino acid analogues that improve stability (or other desired features). AAV8201 to AAV82044 represent specifically claimed peptide sequences which can be used as part of the synthetic peptides of the present invention; AAV82045 to AAV82063 represent specifically claimed examples of the synthetic peptides of the present invention; AAV82045

New synthetic peptide, useful for treating autoimmune disease, rheumatoid arthritis.

The present invention describes synthetic peptides having an amino acid sequence comprising at least 3 residues selected from the group of amino acids consisting of aromatic acids, negatively charged amino acids,

positively charged amino acids, and aliphatic amino acids, the synthetic peptides being at least 7 amino acid residues in length and capable of binding to a major histocompatibility complex (MHC) class II protein associated with an autoimmune disease. The synthetic peptides have anticifiammatory and anti-archritic activities. They are used to treat inflammatory and demyelinating autoimmune diseases, especially rheumatoid archritis and multiple sclerosis. The peptides are specific for archritis and multiple sclerosis. The peptides are specific for particular MHC class II alleles. Purified, short and synthetic peptides should have fewer side effects than mixtures of random peptides; may include many repeate of the active sequence and/or contain amino acid analogues that improve stability (or other desired features). AAY8204 represent specifically claimed peptide sequences which can be used as part of the synthetic peptides of the present invantion; AAY82045 to AAY82063 represent specifically claimed examples of the synthetic peptides from the present invention and AAY82080 represent contain and AAY82080 represent present invention

New synthetic peptide, useful for treating autoimmune disease, e.g. rheumatoid arthritis.

Example 8; Page 32; 57pp; English.

The present invention describes synthetic peptides having an amino acid sequence comprising at least 3 residues selected from the group of amino acids consisting of aromatic acids, negatively charged amino acids, positively charged amino acids, and aliphatic amino acids, the synthetic positively charged amino acids, and aliphatic amino acids, the synthetic binding to a major histocompatibility complex (MrG) class II protein associated with an autoimmune disease. The synthetic peptides have anti-inflammatory and anti-arthritic activities. They are used to treat inflammatory and demyelinating autoimmune diseases, especially rheumatoid

particular MHC Class II alleles. Purified, short and synthetic peptides should have fewer side effects than mixtures of random peptides; may include many repeats of the active sequence and/or contain amino acid analogues that improve stability (or other desired features). AAY82021 to AAY82044 represent specifically claimed peptide sequences which can be used as part of the synthetic peptides of the present invention, AAY82045 to AAY82063 represent specifically claimed examples of the synthetic peptides from the present invention; and AAY82064 to AAY82080 represent other peptides used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         copolymer 1; Cop 1; spin cord injury; injury; insease; i Cell; haemorrhagic stroke; spin cord injury; blunt trauma; trauma; haemorrhagic stroke; schaemic stroke; diabetic neuropathy; Bell's palsy; senile dementia; Alzheimer's disease; Parkinson's disease; glaucoma; facial nerve palsy; Huntington's chorea; amyotrophic lateral sclerosis; status epilepticus; non-arteritic optical neuropathy; vitamin deficiency; HIA-DR molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Promoting nerve regeneration or preventing, inhibiting or treating neuronal degeneration caused by injury or disease comprises administering T cells activated by copolymer 1 (Cop 1) or a Cop 1-related peptide or

The specification describes a method for preventing or inhibiting neuronal degeneration, or for promoting nerve regeneration, or treating neuronal degeneration caused by injury or disease. The method comprises administering activated T cells which have been activated by copolymer 1 (Cop 1) or a Cop 1-related peptide or polypeptide; or Cop 1 or a Cop related peptide. The method is used for preventing or inhibiting neuronal degeneration, or for promoting nerve regeneration, or

ö
treating neuronal degeneration caused by injury or disease comprising spinal cord injury, blunt trauma, penetrating trauma, haemorrhagic stroke, ischaemic stroke, idabetic neuropathy, senile dementia, Alzheimer's disease, Parkinson's disease, facial nerve (Bell's) palsy, glaucoma, Huntington's chorea, amyotrophic lateral sclerosis, status epilepticus, non-arteritic optical neuropathy, or vitamin deficiency. Cop lor the Cop 1-related peptide or polypeptide is useful in the preparation of a medicament for preventing or inhibiting neuronal degeneration, or for promoting nerve regeneration. AAG631206 represent peptides which bind to the peptide binding groove of HLA-DR molecules. The peptides are homologous to the binding motifs of Cop 1, and have similar activities to Cop 1. As such, they may be used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Promoting nerve regeneration or preventing, inhibiting or treating neuronal degeneration caused by injury or disease comprises administering T cells activated by copolymer 1 (Cop 1) or a Cop 1-related peptide or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      epilepticus; non-arteritic optical neuropathy; vitamin deficiency;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a method for preventing or inhibiting neuronal degeneration, or for promoting nerve regeneration, or treating neuronal degeneration caused by injury or disease. The method comprises administering activated T cells which have been activated by copolymer 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Neuronal degeneration; nerve regeneration; injury; disease; T cell;

New compositions comprising synthetic peptides in complex with a major histocompatibility complex class II HLADR2 protein, useful for treating a demyelinating disease, e.g. multiple sclerosis, or post-viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    with an amino acid sequence with tyrosine (Y), Iysine (K), and/or valine residues. The complex of the peptide with a major histocompatibility complex (WHC) class II HIA-DR2 protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions comprising the peptides are useful for treating demyelining in giseases such as multiple sclerosis, post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an anti-tumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen-specific HIA-DR2-restricted T cell clones. ABP52207 to ABP52305 represent peptides used in the exemplification of the present
                                                                                                                     Human leukocyte antigen, HLA; major histocompatibility complex, MHC; HLA-DR2; MHC class II DR-2 molecule; demyelinating; multiple sclerosis; immune response, antiinflammatory; neuroprotective; proliferation; MHC class II protein inhibitor; demyelinating disease; inhibition; post-viral encephalomyelitis; post-vaccine demyelinating condition; anti-tumour necrosis factor agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes compositions (I) comprising a peptide

with an amino acid sequence with tyrosine (Y), lysine (K), and/or value residues. The complex of the peptide with a major histocompatibility complex (MHC) class II HLA-DR2 protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions comprising the peptides are useful for treating demyelinating diseases such as multiple sclerosis, post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an anti-tumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen specific HLA-DR2-restricted T cell clones. ABP52207 to ABP52305 represent peptides used in the exemplification of the present

with an amino acid sequence with tyrosine (Y), lysine (K), and/or value residues. The complex of the peptide with a major histocompatibility complex (MHC) class II HLA-DR2 protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions comprising the peptides are useful for treating demyelinating diseases such as multiple sclerosis, post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an anti-tumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen-specific HLA-DR2-restricted T cell clones. ABP52207 to ABP52305 represent peptides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New compositions comprising synthetic peptides in complex with a major histocompatibility complex class II HLADR2 protein, useful for treating a demyelinating disease, e.g. multiple sclerosis, or post-viral

                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                         The invention relates to a vaccine that comprises an active agent from Copolymer 1 (Cop-1), Cop-1 related peptide, Cop-1 related polypeptide or poly-Glu,Tyr. The vaccine comprises the active agent without adjuvant or is emulsified in an adjuvant. The vaccine is useful for reducing disease protection from protection of motor nerve degeneration and/or protection from glutamate toxicity in motor neuron disease e.g. protection from glutamate toxicity in motor neuron disease e.g. mulscular atrophy, progressive pulbar palsy (PBP or bulbar onset). It may be used in combination with another drug e.g. Riluzole for treating motor neuron disease. The non-pathogenic synthetic copolymers protects autoimmunity and thus reduces further injury-induced damage and protects central nervous system cells from glutamate toxicity; protects retinal ganglion cells from glutamate toxicity; protects retinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                             Vaccine useful in the treatment of motor neuron disease e.g. amyotrophic lateral sclerosis and progressive muscular atrophy, comprises copolymer-1 or related peptide or polypeptide, or poly-Glu, Tyr.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a vaccine that comprises an active agent from Copolymer I (Cop-1), Cop-1 related peptide, Cop-1 related polypeptide or poly-Glu, Tyr. The vaccine comprises the active agent without adjuvant or is emulsified in an adjuvant. The vaccine is useful for reducing disease progression and/or protection of meter nerve degeneration and/or protection of meter nerve degeneration and/or protection of motor neuron disease e.g. muscular atrophic lateral sclerosis, primary lateral sclerosis, progressive muscular atrophy, progressive bulbar palsy (PBP or bulbar onset). It may be used in combination with another drug e.g. Riluzole for treating motor neuron disease. The non-pathogenic synthetic copolymers protects autoimmunity and thus reduces further injury-induced damage and protects central nervous system cells from glutamate toxicity; protects retinal ganglion cells from glutamate toxicity. The present sequence represents a Cop-1 related-peptide.
                                                                                                                                                                                                                                                                                                                                                                          Vaccine useful in the treatment of motor neuron disease e.g. amyotrophic lateral sclerosis and progressive muscular atrophy, comprises copolymer-1 or related peptide or polypeptide, or poly-Glu, Tyr.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WO2003047500-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 15 AA;
```

peripheral nervous system (e.g. Alzheimer's disease), comprises Copolymer

The invention relates to a vaccine that comprises an active agent from Copolymer I (Cop-1), Cop-1 related peptide, Cop-1 related polypeptide or poly-Glu,Tyr. The vaccine comprises the active agent without adjuvant or is emulaified in an adjuvant. The vaccine is useful for reducing disease progression and/or protection of metor nerve degeneration and/or protection of metor nerve degeneration and/or protection from glutamate toxicity in metor neuron disease e.g. muscular atrophic lateral sclerosis, primary lateral sclerosis, progressive muscular atrophy, progressive bulbar palsy (PBP or bulbar onset). It may be used in combination with another drug e.g. Riluzole for treating motor neuron disease. The non-pathoganic synthetic copolymers protects autoimmunity and thus reduces further injury-induced damage and protects central nervous system cells from glutamate toxicity; protects retinal cop-1 related-peptide. Vaccine useful in the treatment of motor neuron disease e.g. amyotrophic lateral sclerosis and progressive muscular atrophy, comprises copolymer-1 or related peptide or polypeptide, or poly-Glu, Tyr. Disclosure; SEQ ID NO 23; 49pp; English.

Eye-drop vaccine for the therapeutic immunization of a mammal against glaucoma and neuronal degeneration caused by a disease in the central or peripheral nervous system (e.g. Alzheimer's disease), comprises Copolymer

Disclosure, SEQ ID NO 29; 49pp; English.

Caused by an injury, disease, disorder or condition in the central nervous system (CNS) or peripheral nervous system (PNS), for preventing nervous system (CNS) or peripheral nervous system (PNS), for preventing or inhibiting neuronal secondary degeneration which may otherwise follow a primary injury in the CNS, for promoting nerve regeneration in the CNS or in the PNS after an injury, disease, disorder or condition or for protecting CNS and PNS cells from glutamate toxicity, where the injury is spinal cord injury, blunt trauma, penetrating trauma, brain coup or contraccoup, hemorrhagic stroke or lachaemic stroke, and where the disease is a senile dementia including Alzheimer's disease, a coup or contraccoup, hemorrhagic stroke or lachaemic stroke, and where the disease is a senile dementia including Alzheimer's disease, a more nerve disease, a more repeated in the contraction in contraction, schorea, a more neuron disease including amyotrophic lateral sclerosis, a prion disease including creutzfeldtusk disease, Alber's disease, Batten disease, Cockaptne syndrome, Lewy body disease, status epilepticus, carpal tunnel syndrome, intervertebral disc herniation, vitamin deficiency such as vitamin B deficiency, cordative stress, opiate tolerance and dependence, an autoimmune disease (e.g. multiple sclerosis), or a peripheral neuropathy, uremic neuropathy, popplycaemia, Sjognen-Larsson syndrome, acute such as amyloid polyneuropathy, diabetic neuropathy, malabsorption syndromes, polycythemia vera, igh and igg gammapathies, complications of such as alcohol or organophosphates, derromedally, independence, and autoimmapathies, porphyrications of various drugs such as nitrofurantoin, metromapathy, age-related macular degeneration, a retinal degeneration, or a disease, ataxia cells of soniared by an retinal degeneration, or a disease, importation, a retinal disease, shark a retinal degeneration, or a disease, importation, a retinal disease, in the contraction of the contraction or contractions or contractions or contractions The present invention describes an eye-drop vaccine (I) for the therapeutic immunisation of a mammal. (I) comprises an active agent selected from Copolymer 1, a Copolymer 1-related peptide, and a Copolymer 1-related polypeptide. (I) has ophthalmological, neuroprotective, nootropic, antiparkinsonian, anticonvulsant, analgesic, antidiabetic, hepatotropic, respiratory and osteopathic activities. The eye-drop vaccine (I) can be used for treating or preventing neuronal degeneration abnormally elevated intraocular pressure such as glaucoma. The present sequence represents a copolymer 1 related peptide, which is given in the exemplification of the present invention.

Aharoni R, Arnon R,

Kayhan B;

Composition useful for the treatment of a patient suffering from an infilammetory bowel disease comprises an active agent selected from copolymer 1, a copolymer 1-related polypeptide, and a copolymer 1-related peptide and a carrier.

Example 2; SEQ ID NO 20; 55pp; English.

an active agent selected from copolymer 1, a copolymer 1-related polypeptide, and a copolymer 1-related peptide and a carrier. Also described is an article of manufacture comprising packaging material and the pharmaceutical composition (preferably containing copolymer 1) contained within the packaging material. The packaging material includes present invention describes a pharmaceutical composition comprising The

ö pharmaceutical composition; copolymer 1; copolymer 1-related polypeptide; copolymer 1-related peptide; inflammatory bowel disease; antiinflammatory; antiulcer; gastrointestinal; regulatory T cell inducer; Crohn's disease; ulcerative colitis. a label that indicates that the agent is used for treating an inflammatory bowel disease. The pharmaceutical composition has antiinflammatory, antiulder and gastrointestinal activities, and can be used as an inducer of regulatory T cells of the Th2 type. It can be used for the treatment of a patient suffering from an inflammatory bowel disease e.g. Crohn's disease and ulcerative colitis. The copolymer 1 binds promiscuously and with high affinity to various classes II MHC molecules of mouse and human origin, and can even displace antigens from the MHC antigen binding groove. In this way, the presentation of other antigens and, consequently, the persistence of inflammatory process, are down regulated. In addition, Copolymer 1 is a potent inducer of regulatory T cells of the Th2 type. The present sequence represents a copolymer 1-related peptide which is used in the exemplification of the Gaps ö Score 47; DB 8; Length 15; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pharmaceutical composition; copolymer 1; copolymer 1-related polypeptide; copolymer 1-related peptide; inflammatory bowel disease; antiinflammatory; antiulcer; gastrointestinal; regulatory T cell inducer; Crohn's disease; ulcerative colitis.
used as an inducer of regulatory T cells of the Th2 type. It can be used discase e.g. cron's disease and ulcerative colitis. The copolymer 1 binds promiseuously and with high affinity to various classes II MHC molecules of mouse and with high affinity to various classes II MHC molecules of mouse and human origin, and can even displace antigens from the MHC antigen-binding groove. In this way, the presentation of other antigen-binding groove. In this way, the presentation of other down regulated. In addition, Copolymer 1 is a potent inducer of regulatory T cells of the Th2 type. The present sequence represents a copolymer 1-related peptide which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an active agent selected from copolymer 1, a copolymer 1-related polypeptide, and a copolymer 1-related peptide and a carrier. Also described is an article of manufacture comprising packaging material and the pharmaceutical composition (preferably containing copolymer 1) contained within the packaging material. The packaging material includes a label that indicates that the agent is used for treating an inflammatory bowel disease. The pharmaceutical composition has antilnflammatory antilocar and gastrointestinal activities, and can be used as an inducer of regularory T calls of the Thi type. It can be used for the treatment of a patient suffering from an inflammatory bowel disease and ulcerative colitis. The copolymer 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a pharmaceutical composition comprising

This invention relates to a novel method for treating or preventing graft rejection. Specifically, it refers to administering at least one copolymer 1 or its related heteropolymer with at least one immunosuppressive drug. The present invention describes the copolymer as containing at least three of the following proups: lysine and arginine; glutamic acid and appartic acid; alanine, glycine and alanine; and tyrosine, tryptophan and phenylalanine. In addition, the immunosuppressive drug is an antiproliferative drug, inhibitor of lymphocyte acitivation, steroid, purine antimetabolite, antibody or immunoaculator. Accordingly, these immunosuppressive compositions can be used for treating or preventing or graft rejection associated with transplantation of cells, tissue or or organs (HiA-matched or mismatched) selected from hematopoietic cells, cremit cells, heart, lung, kidney, liver or skin. The copolymer 1 or its related heteropolymer in combination with other immunosuppressive drugs.
                                                                                                                                                                                                                                                                ö

This invention relates to a novel method for treating or preventing graft rejection. Specifically, it refers to administering at least one copolymer 1 or its related heteropolymer with at least one compositions to resent invention describes the copolymer as containing at least three different amino acids each selected from at containing at least three different amino acids each selected from at cast three of the following groups: lysine and arginine; glutamic acid and aspartic acid; alanine, glycine and alanine; and tyrosine, tryptophan can phroliferative drug, inhibitor of lymphocyte activation, steroid, antiproliferative drug, inhibitor of lymphocyte activation, steroid, curine antimetabolite, antibody or immunomodulator. Accordingly, these immunosuppressive compositions can be used for treating or preventing graft rejection associated with transplantation of cells, tissue or cyans (HiA-matched or mismatched) selected from hematopoietic cells, stem cells, heart, lung, kidney, liver or skin. The copolymer 1 or its increases the effortiveness of the immunosuppressive drugs increases the effortiveness of the immunosuppressive drugs increases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating or preventing graft rejection associated with transplantation of cells, tissue or organs comprises administering combination comprising copolymer 1 or its related heteropolymer with immunosuppressive drug for.
                                                                                                                                                                                                                                                                                                                                                                                           Ordered copolymer peptide used to treat graft versus host disease Seg 23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               increases the effectiveness of the drugs at lower dosages, reducing side effects such that they are useful for host-versus-graft (HVG) response, as well as graft-versus-host disease (GVHD). This peptide sequence is an ordered copolymer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 47; DB 9; Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for treating or preventing graft rejection. Specifically, it refers to administering at least one copolymer 1 or its related heteropolymer with at least one immunosuppressive drug. The present invention describes the copolymer as containing at least three different amino acids each selected from at least three of the following groups: lysine and arginine; glutamic acid and abspartic acid; alanine, glycine and alanine; and tyrosine, tryptophan and phenylalanine. In addition, the immunosuppressive drug is an antiproliferative drug, inhibitor of lymphocyte activation, steroid, purine antimerabolite, antibody or immunomodulator. Accordingly, these immunosuppressive compositions can be used for treating or preventing graft rejection associated with transplantation of cells, tissue or crans (HiA-matched or mismatched) selected from hematopoietic cells, stem cells, heart, lung, kidney, liver or skin. The copolymer 1 or its related heteropolymer in combination with other immunosuppressive drugs increases the effectiveness of the drugs at lower dosages, reducing toxic side effects such that they are useful for host-versus-graft (HVG) response, as well as graft-versus-host disease (GVHD). This peptide sequence is an ordered copolymer of the invention.
                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating or preventing graft rejection associated with transplantation of cells, tissue or organs comprises administering combination comprising copolymer 1 or its related heteropolymer with immunosuppressive drug for.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ordered copolymer peptide used to treat graft versus host disease Seg 20.

This peptide represents a peptide derived from Cop 1 (Copolymer 1). This peptide was tested for binding to the peptide binding groove of HLA-DR. The method of the invention for treating a neurodegenerative disorder or disease in which there is accumulation of misfolded and/or aggregated proteins, excluding prion-related diseases, comprises administering to an individual an agent selected from Copolymer 1, a Copolymer 1 related polypeptide, and T cells activated with then. The invention also includes methods for: reducing disease copy protection from glutamate toxicity in a patient suffering from a neurodegenerative disease or disorder selected from Huntington's disease, Alzheimer's disease or disorder selected from Huntington's disease.

Alzheimer's disease and Parkinson's disease, and treating or preventing neurodegenerative and cognitive decline and offsenting from a neurodegenerative disease, Alzheimer's disease or Parkinson's disease.

Specifically, treating a patient suffering from a neurodegenerative comprises immunizing the patient with a vaccine comprising Copolymer 1 for reducing disease progression or for protection from neurodegeneration in the patient. A pharmaceutical composition as administered in the method above, is useful for reducing disease.

Cromprising Copolymer 1 for reducing disease progression or for protection from neurodegeneration in the patient. A pharmaceutical composition as administered in the method above, is useful for reducing disease.

Cromprising corder or protection from neurodegenerative disorder or disease, such as Huntington's disease, Alzheimer's disease or Parkinson's disease. The active agent is useful for reducing a medicament for treatment of neurodegenerative disorder or disease, such as Huntington's disease.

Alzheimer's disease on Parkinson's disease. The active agent is useful for aggregated proteins, excluding prion-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating a neurodegenerative disorder or disease where there is accumulation of misfolded and/or aggregated proteins e.g. Parkinson's disease comprises using an agent e.g. Copolymer 1 or a Copolymer 1-related peptide.
                                                                                                                                                                                                                                    Anticonvulsant; Nootropic; Neuroprotective; Antiparkinsonian; Cop 1; Copolymer 1; HLA-DR; neurodegenerative disease; glutamate toxicity; Huntingtons disease; Alzheimers disease; Parkinsons disease.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Members of the MAZ family: A novel CDNA clone for MAZ from human pancreatic isl
A;Reference number: JC5076; MUID:96428591; PMID:8831693
                                                                                                                                                                                            A; Experimental source: pancreatic islet
C; Comment: This protein plays a role in the control of transcriptional initiation of gen
and between the introns of the mouse gene for immunoglobulin M-D.
C; Keywords: phosphoprotein; zinc finger
F;146,204,480/Binding site: phosphate (Ser) (covalent) (by casein kinase II) #status pre
F;349/Binding site: phosphate (Tyr) (covalent) #status predicted
